Flask Web Architecture & Routing Guide

Blueprints, Jinja2 Templating, Session Security & MongoDB Access

Shared on SkillExchange Hub • Author: Alex Chen • Date: October 2026

1. Application Structure

- Separation of concerns: models for data, templates for presentation, utils for helpers.
- Environment configuration via python-dotenv for secret keys and Mongo URIs.
- Custom template filters for human-readable dates and file sizes.

2. Jinja2 Templating Power

- Use base.html as the primary shell with sticky navigation and flash messaging.
- Employ block inheritance: {% extends 'base.html' %} and {% block content %}.
- Safe URL routing using url_for('route_function_name', **params).

3. Session Security & Flash Notifications

- Never store unhashed passwords in session cookies.
- Flash categories: 'success' (green), 'danger' (red), 'info' (blue), 'warning' (amber).
